Subject: ethanol fuel for automobiles

Congratulations on your appointment! I would like to ask you to please consider the amount of ethanol which is currently being used in gasoline fuels for gasoline engines in use on the roads in this country. The use of 10% ethanol does create drivability issues in gas engine vehicles especially in hot climates. It is also very corrosive causing substantial costly repairs. In addition vehicle mileage is considerably reduced by the addition of ethanol.

Would it be possible to either eliminate or greatly reduce the percentage of ethanol in gasoline fuels for public use? If not can we get more gasoline outlets that would carry non-ethanol gas at an affordable price? Thanks for your consideration. Larry Luck.
